# 1 EMSC e-Course template

This is a template repository for Lecture notes that include a computational component. It builds a website from the notes and includes live-links to source code that will run on [binder](#). This template is pre-configured for courses at Research School of Earth Sciences, but is freely available for adoption elsewhere.

I use the [Quarto](#) publication system which converts simple markdown formatted documents to webpages, pdf and slides. Quarto is designed to develop reusable content and is based around [pandoc](#): you should be able to quickly import and convert content to the quarto version of markdown (especially if you have been using jupyter-book or myst-md - the concepts are very similar).

To use this repository, you will need make a fork for yourself and replace this content with your own. You will also need set a few configuration options to match the course metadata. I'm going to explain how this works.

# **Part I**

## **Introduction**

## 2 Introduction

This is a book created from markdown and executable code.

See Knuth (1984) for additional discussion of literate programming.

# **Part II**

## **Details**

## 3 Summary

In summary, this book has no content whatsoever.
